

Foliensatz

- coderdojo.red/images/kyo-6/ATTiny.pdf
- erste Lötübung auch auf coderdojo.red/kyo-7/

Batterie einsetzen

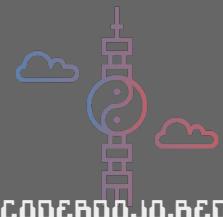

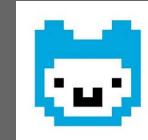

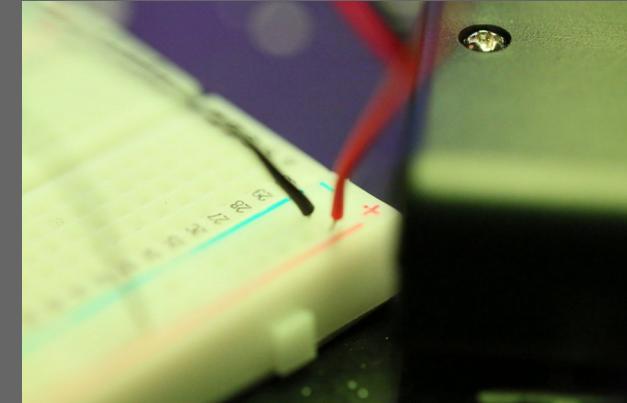

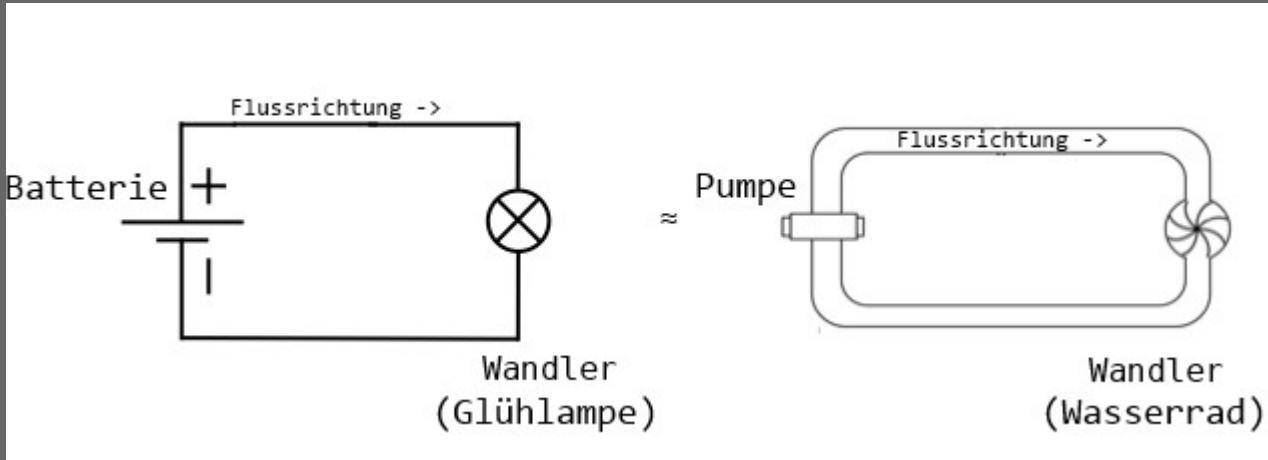

- 1) Schraube auf
- 2) aufschieben
- 3) Batterien gepolt einsetzen
- 4) schließen
- 5) Schraube rein

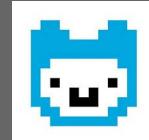

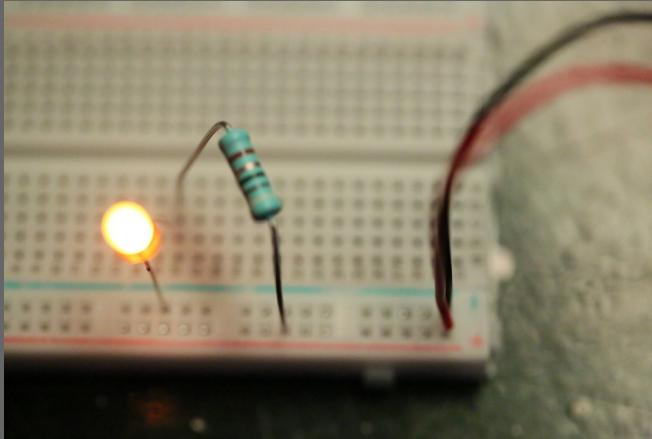

Schaltung aufbauen

- Stromkreis aufbauen

Schaltung aufbauen

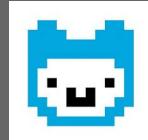

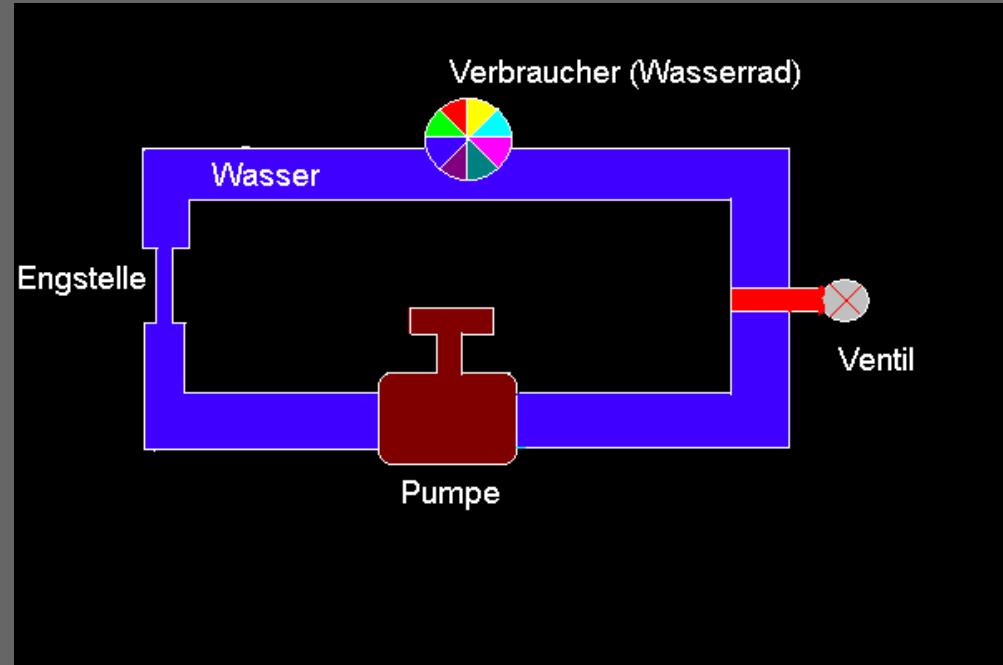

- Widerstand 220 Ω

CODERODOJO.EDU

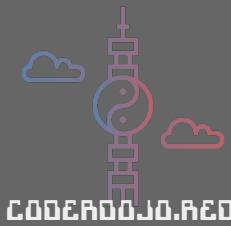

Schaltung aufbauen

- Widerstand
 - reduziert die Strom / Spannung

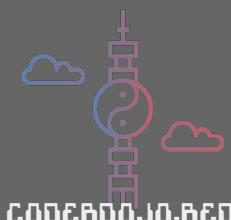

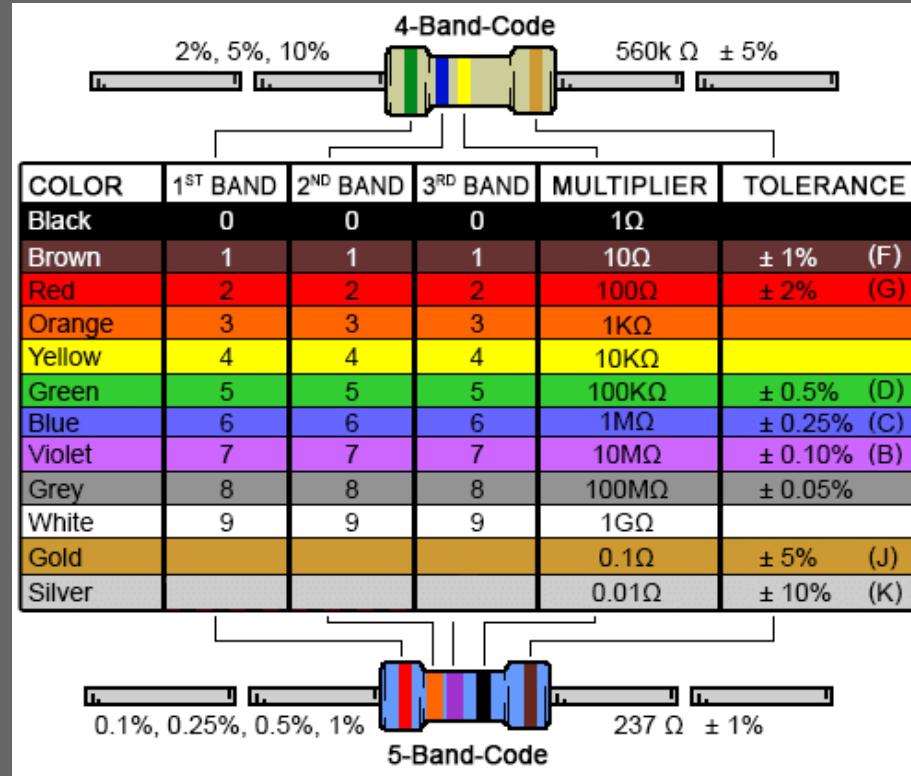

Schaltung aufbauen

- Widerstand
 - reduziert die Strom / Spannung

Schaltung aufbauen

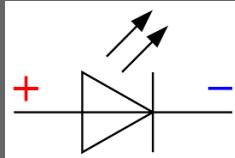

- Widerstand

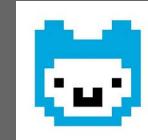

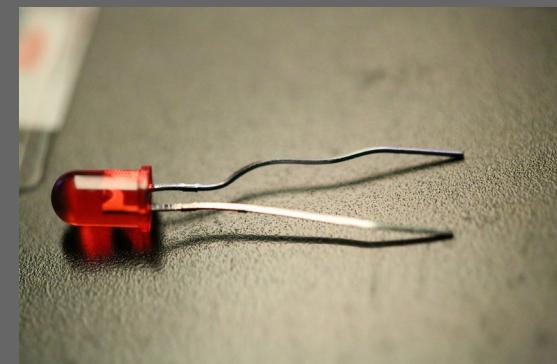

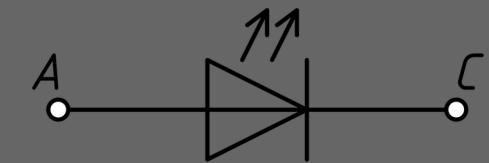

CODERDOJO.RED

Schaltung aufbauen

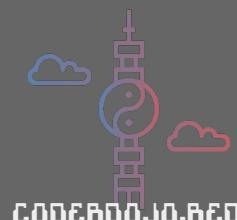

- LED

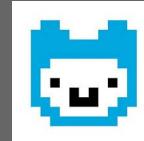

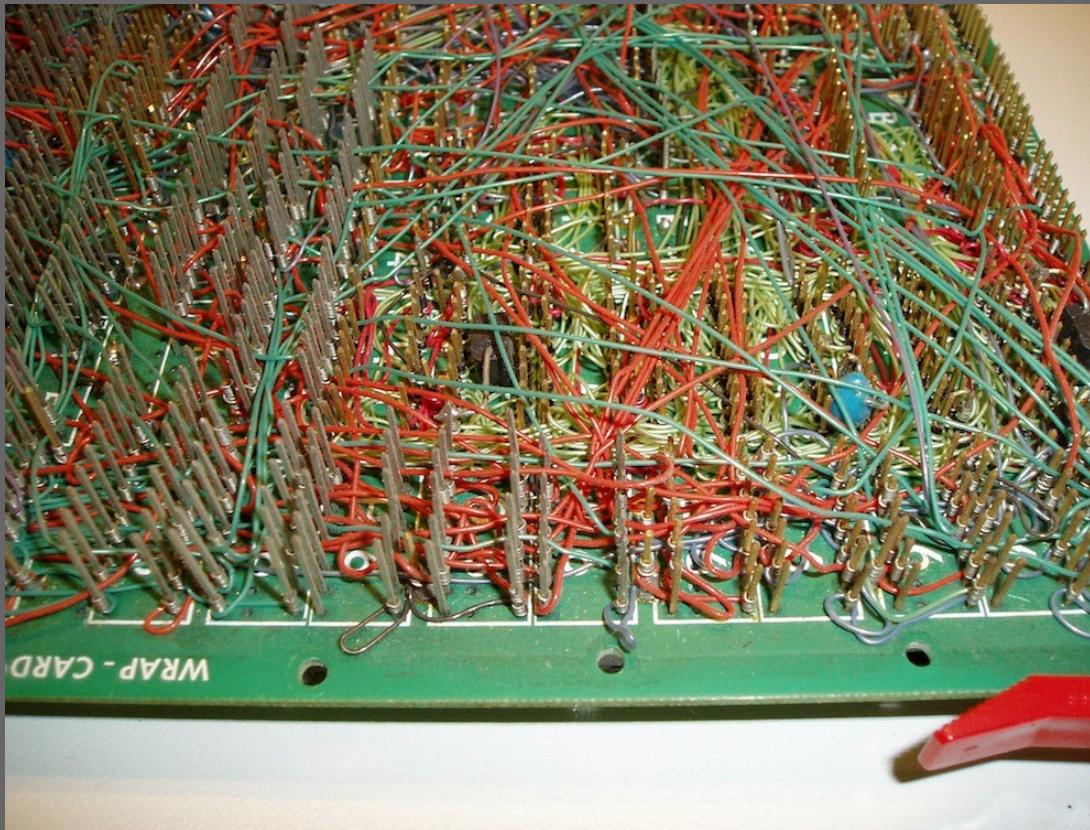

- kurzes Bein → Kathode → - - Pol
- langes Bein → Anode → + - Pol
- LEDs mögen keine hohe Spannung,
deshalb brauchen sie in aller Regel
einen Widerstand!

Warum Breadboard?

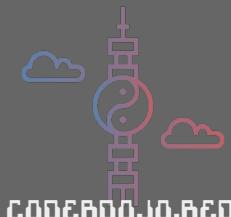

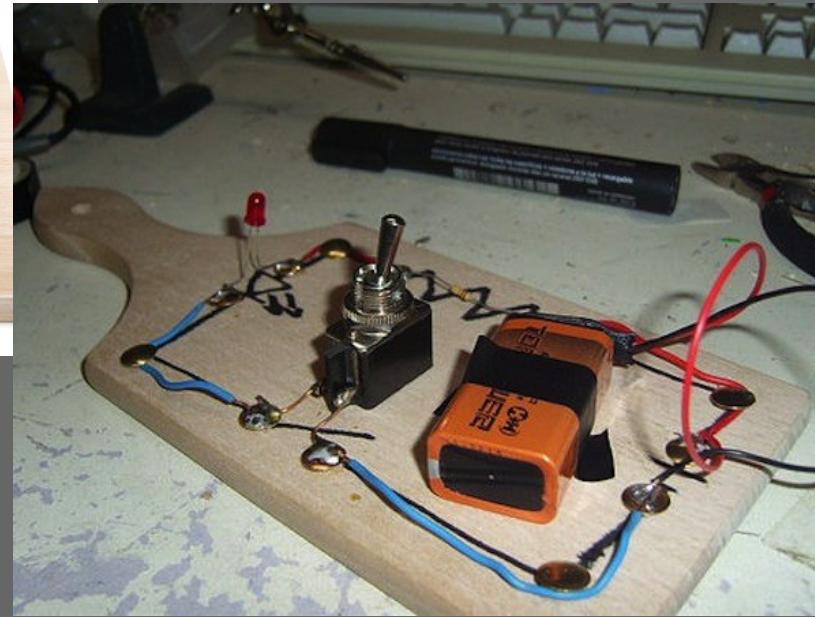

Darum Breadboard?

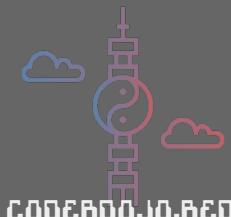

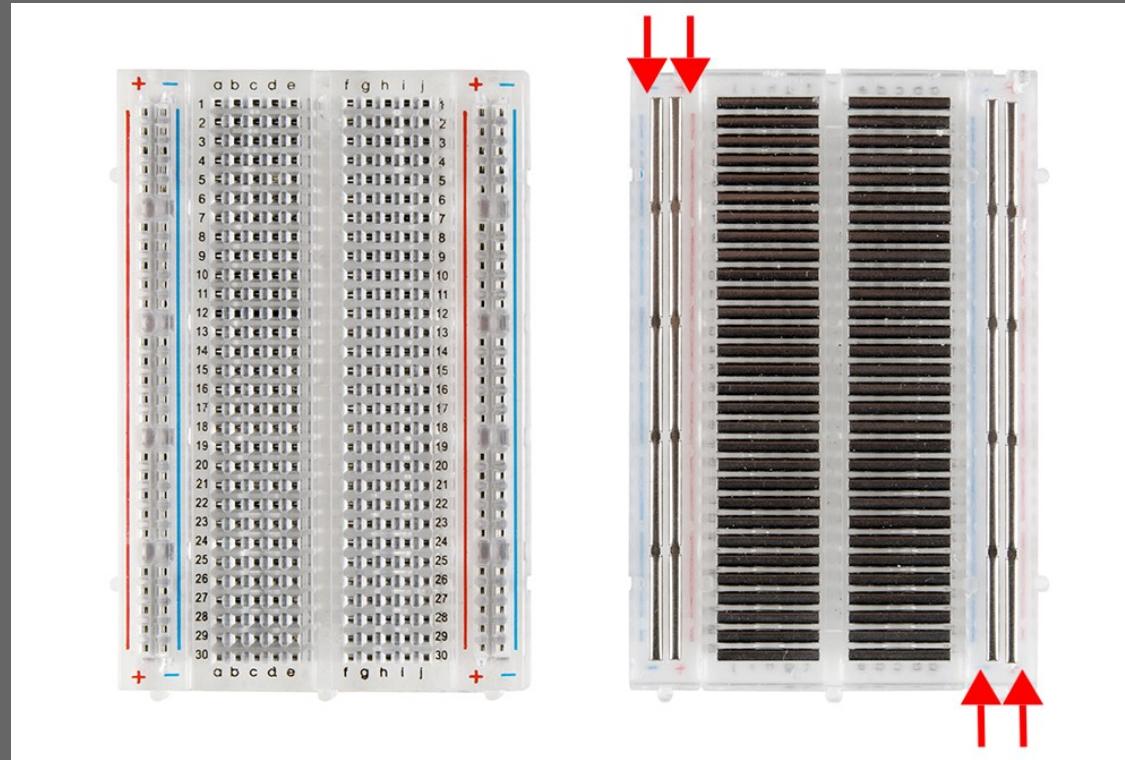

CODERDOJO.RED

Erste Versuche der Besserung...

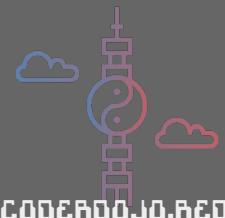

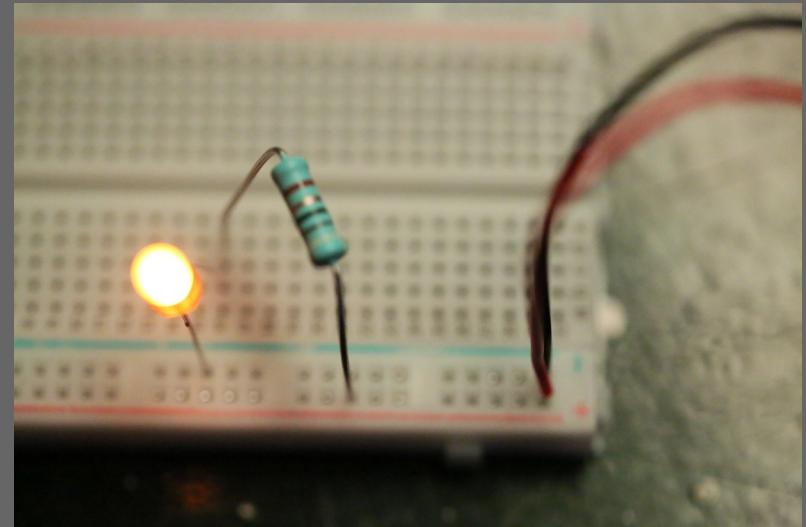

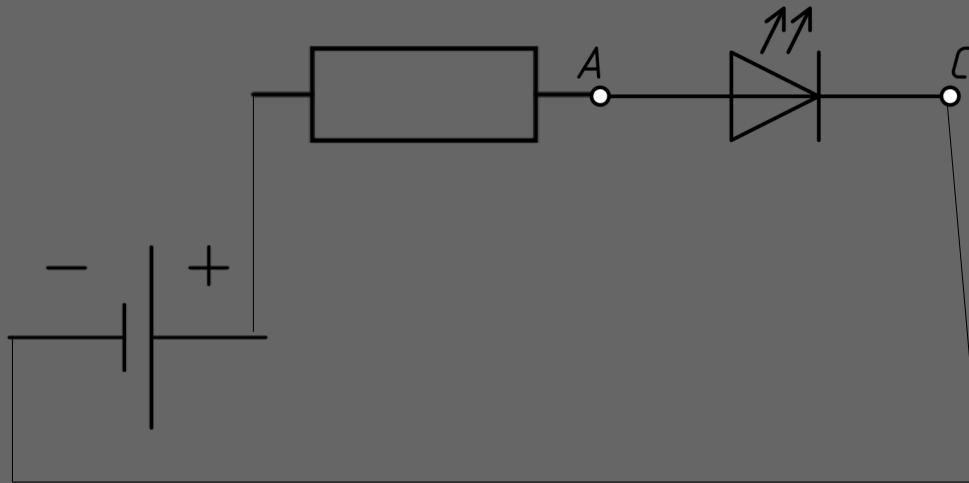

CODERDOJO.NEO

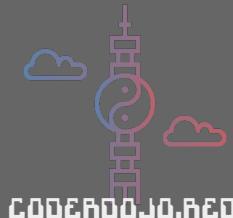

Wie funktioniert ein Breadboard?

Löten

Strom an – leuchtet die LED?

CODERDOJO.RED

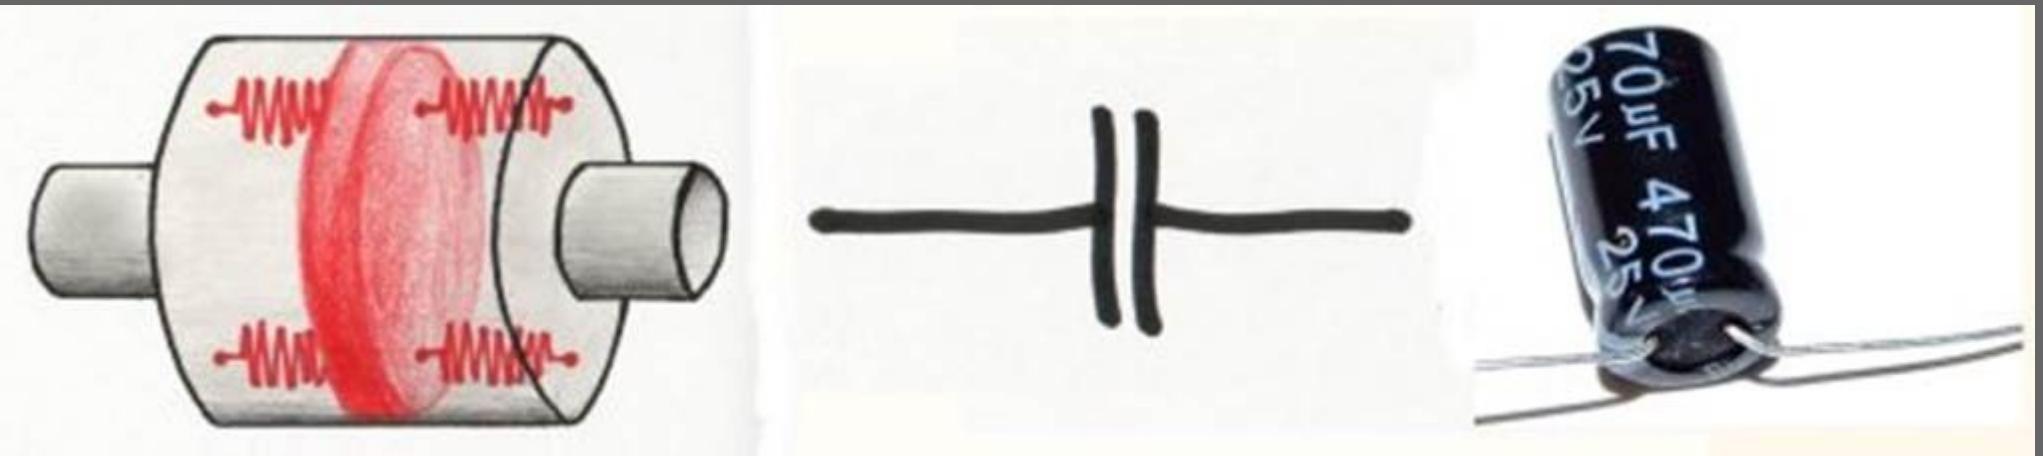

benötigte Bauteile – stückchenweise

- 220 Ω Vorschalt-Widerstand
- 10 μF Kondensator
- IC-Sockelhalter mit IC
- LED-Stripe
- Stripe-Verbinder
- plus Teile von eben

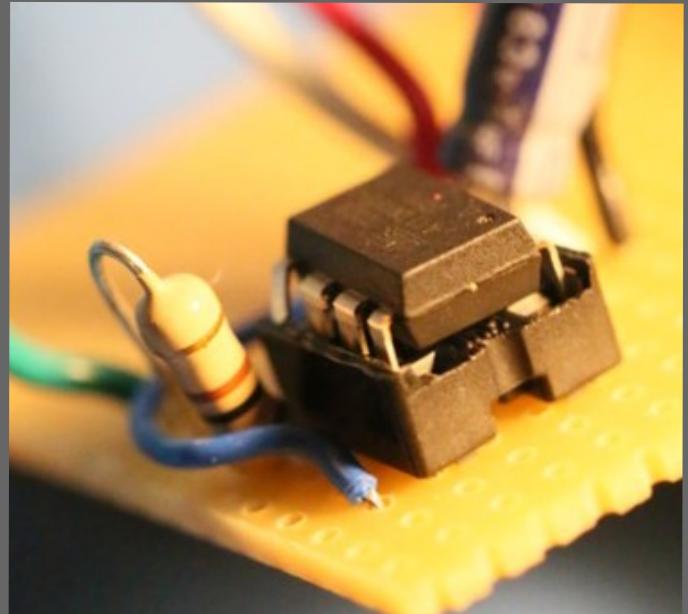

Neue Bauteile – kurz erklärt

- Kondensator → F – Farad (Faraday → Käfig)
- fängt Spannungsspitzen ab (⚡ Wasserkreislauf)

Neue Bauteile – kurz erklärt

- IC → integrated circuit
(integrierter Schaltkreis)
- enthalten vor allem Transistoren,
aber auch Widerstände und
Kondensatoren (und teilweise mehr)
- Transistoren sind vereinfacht Schalter
- ATTiny85 → Mikrocontroller, enthält
noch Prozessor, also Recheneinheit und Speicher

Blinklicht mit Microcontroller

- vorher kurze Pause!

CODEROOJO.RED

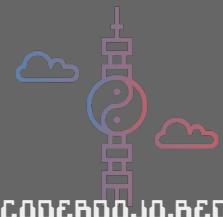

1. Schritt

- Stromzufuhr, LED und Widerstand auslöten

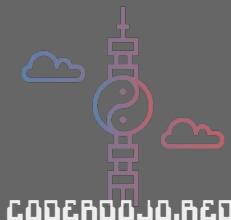

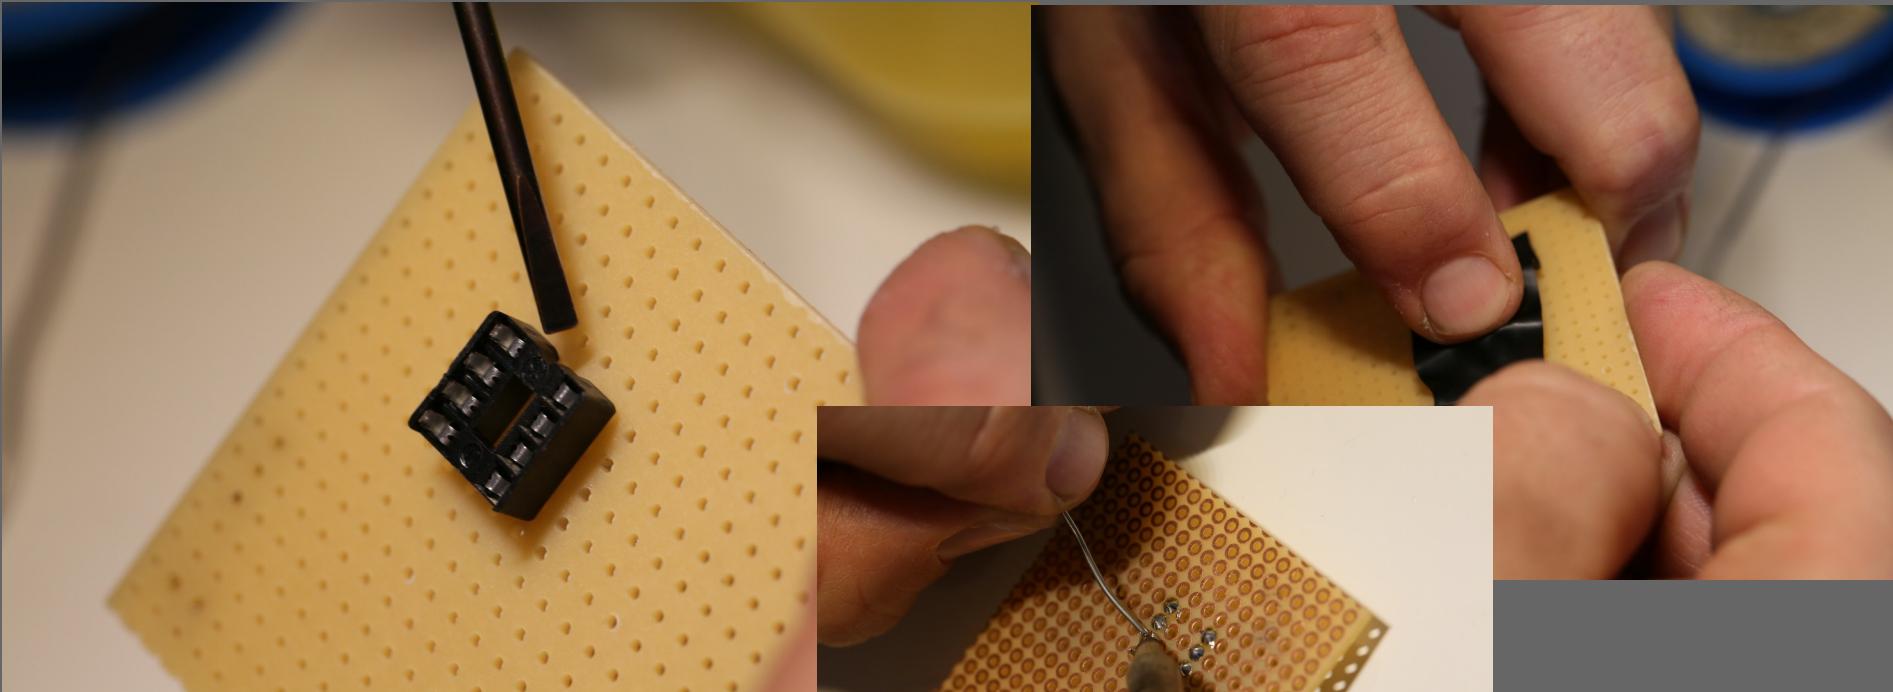

1. Schritt

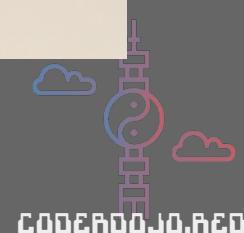

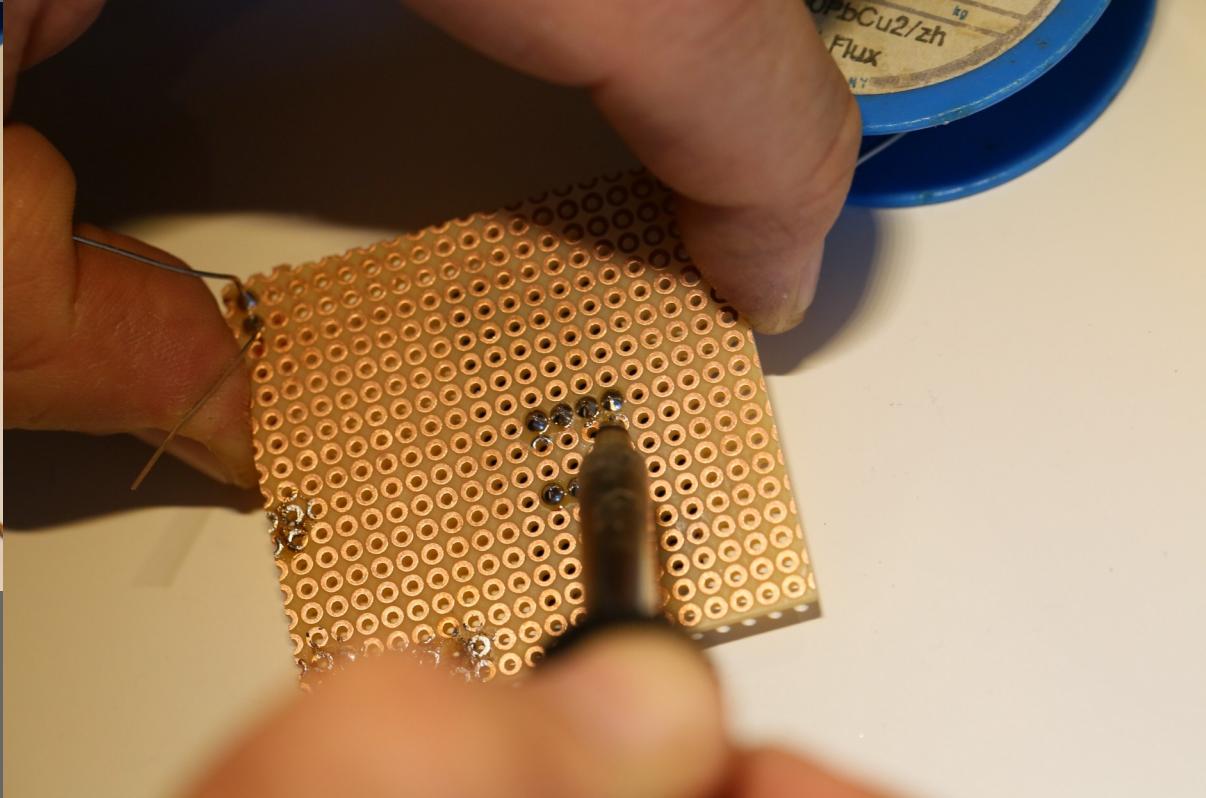

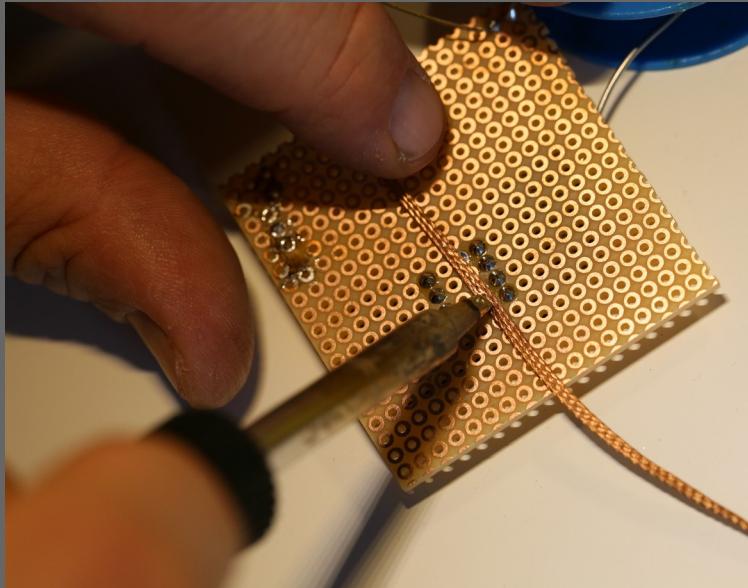

- IC-Sockelhalter anlöten
 - daran denken: Lötspitze an den Pin, dann Lötzinn drauf; nicht das Lötzinn an die Spitze halten und es “klecksen” lassen

1. Schritt

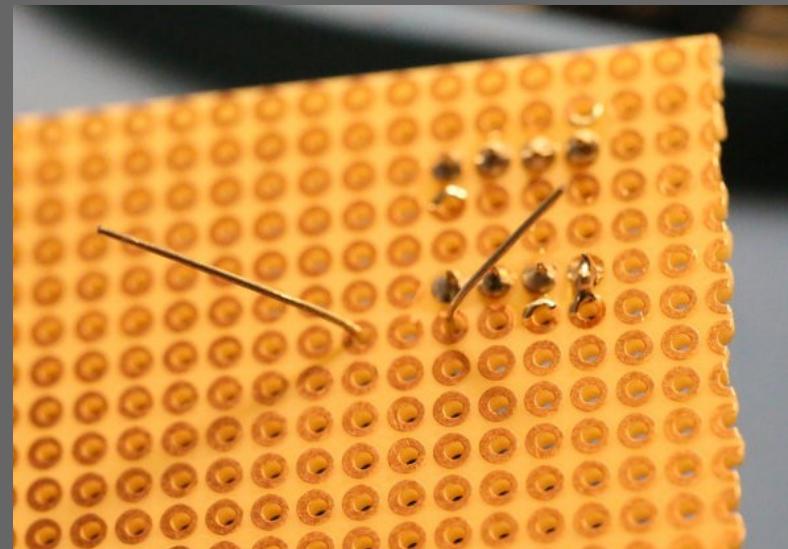

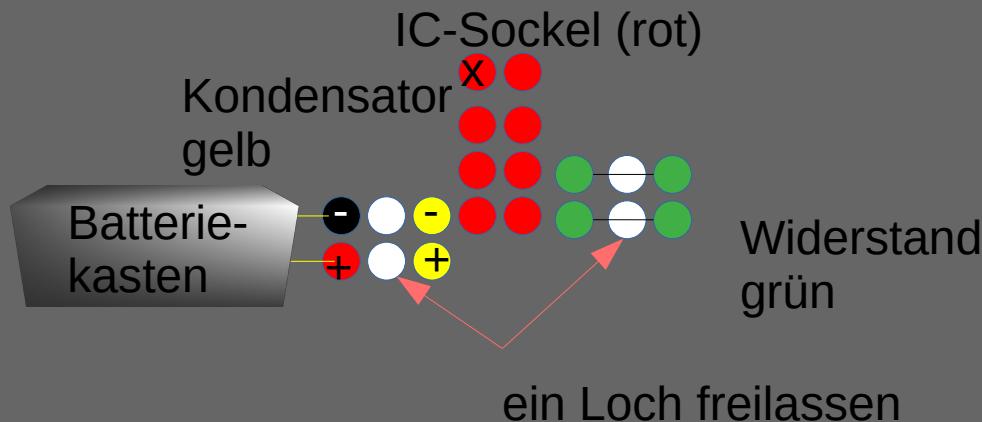

1. Schritt

1. Schritt

- Sockel, Kondensator und Widerstände einlöten

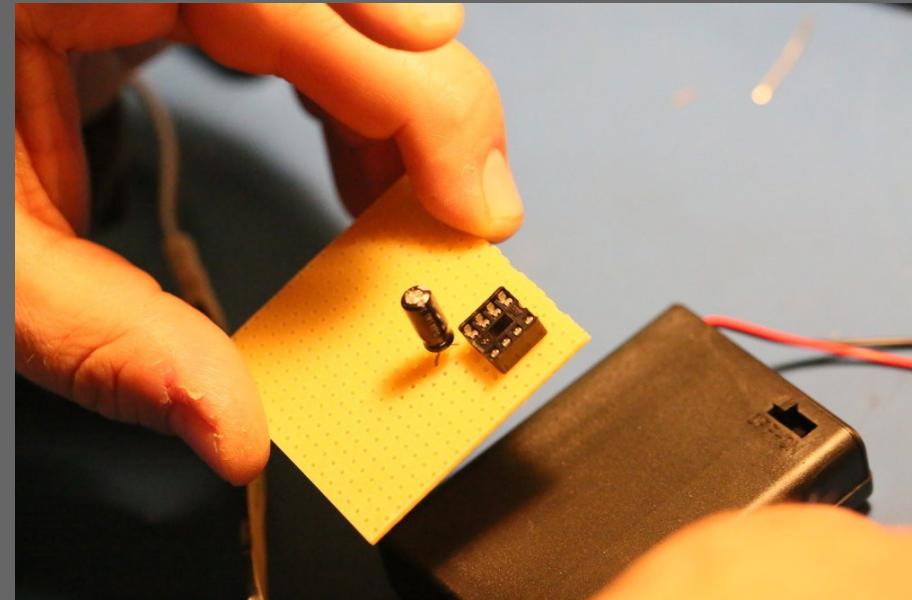

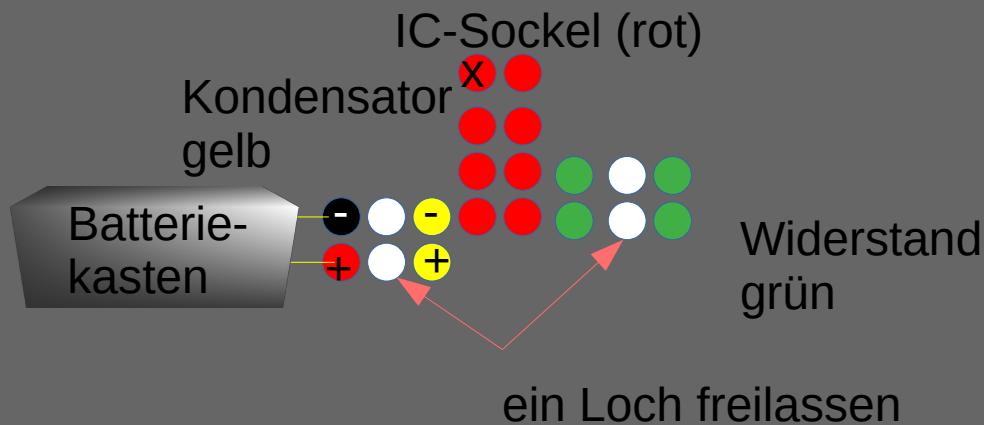

Aufsicht

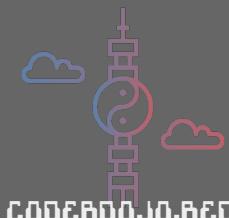

2. Schritt

- Batteriekontakte einlöten

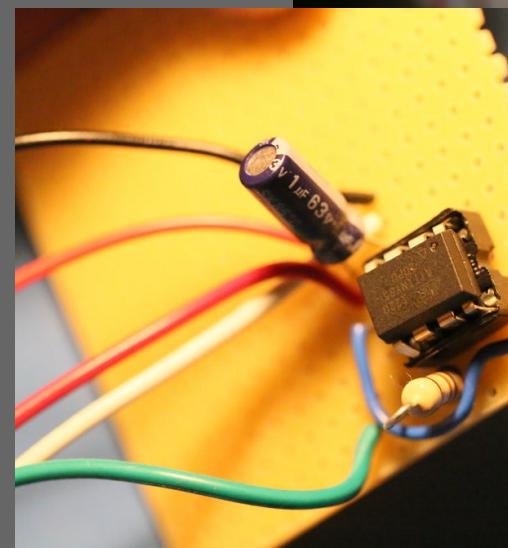

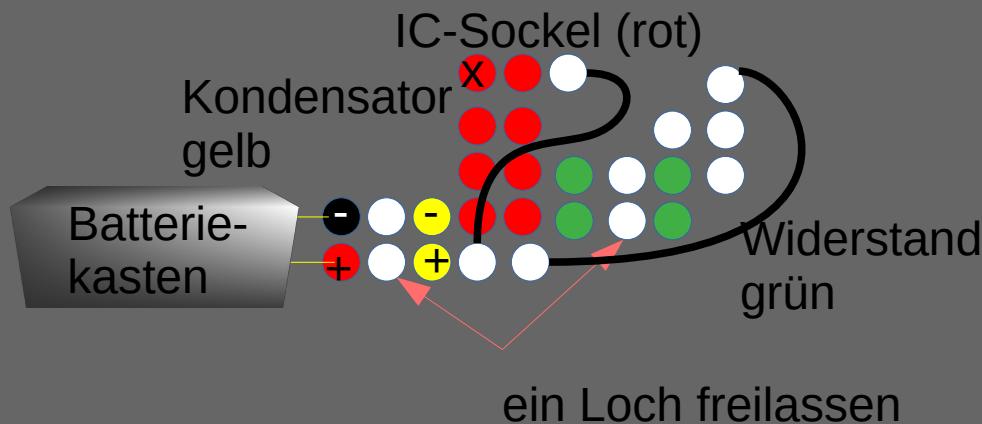

Aufsicht

3. Schritt

- Drahtbrücke löten

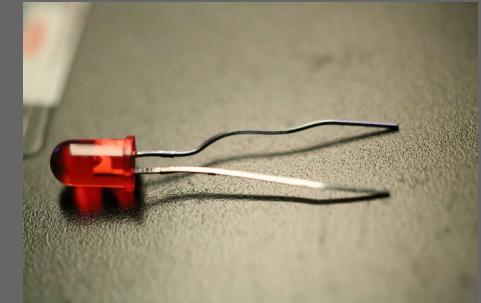

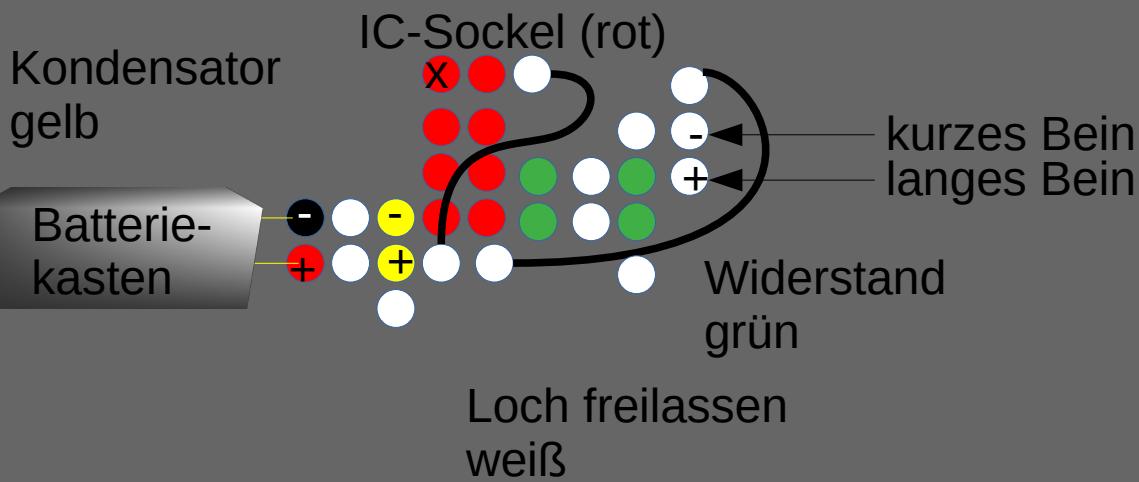

Aufsicht

CODERDOJO.RO

4. Schritt

- LED einlöten – volle Konzentration bei der Polung!

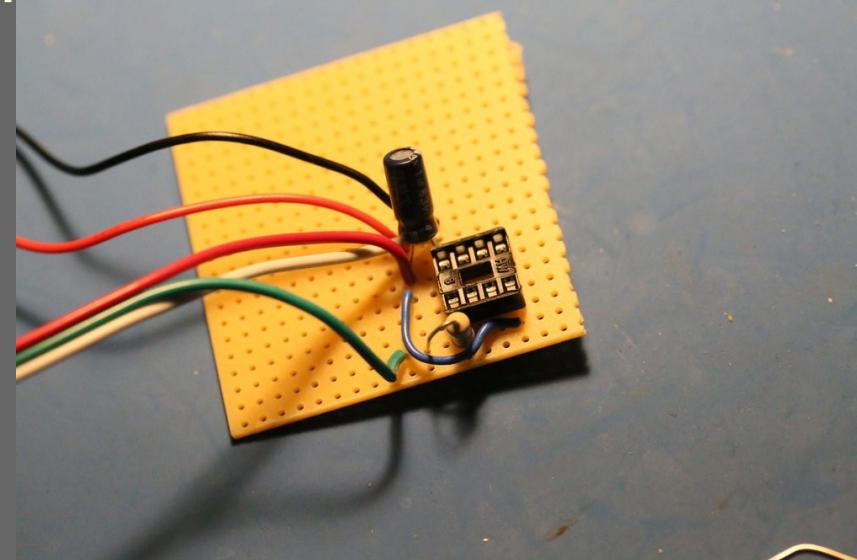

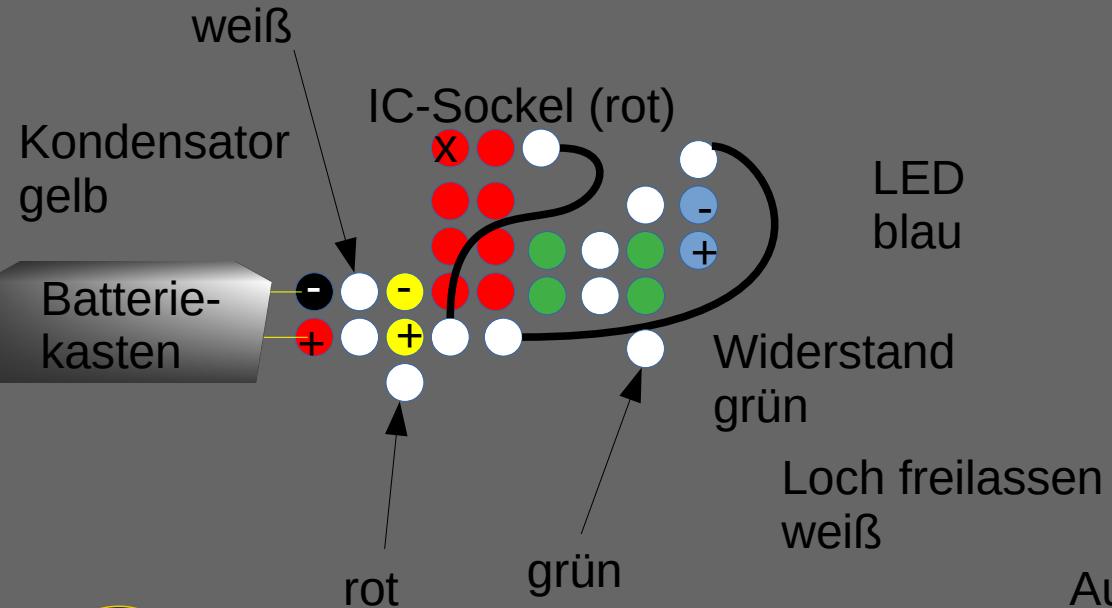

Aufsicht

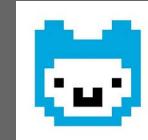

CODERDOJO.NEO

5. Schritt

- LED-Stripe-Connector einlöten – Löten nach Farben!

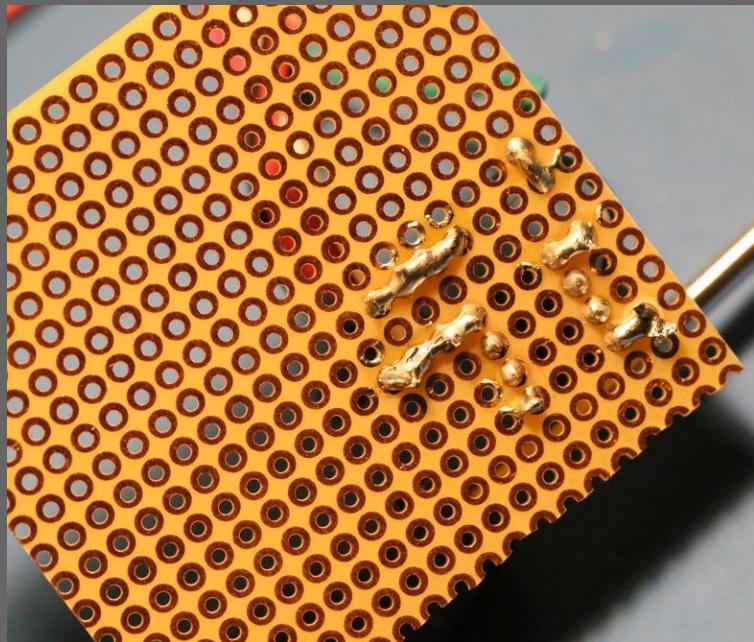

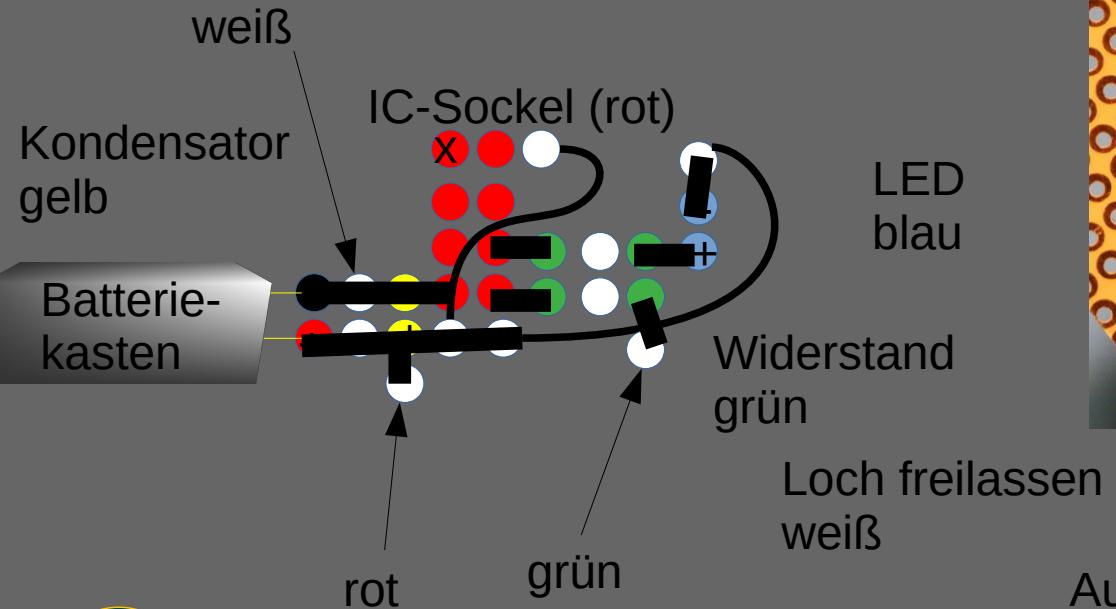

Aufsicht

CODERDOJO.EDU

6. Schritt

- Brücken löten

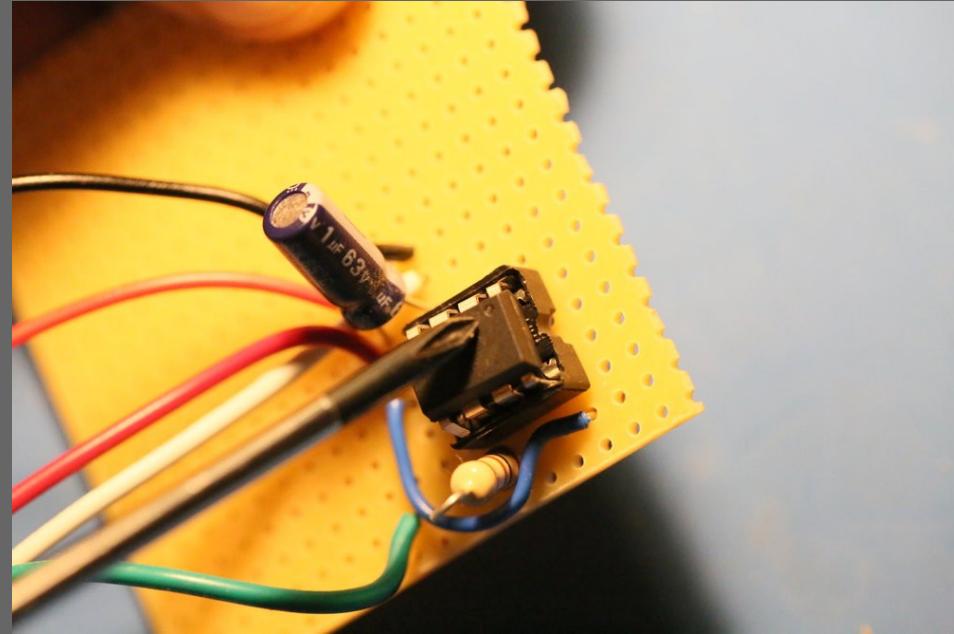

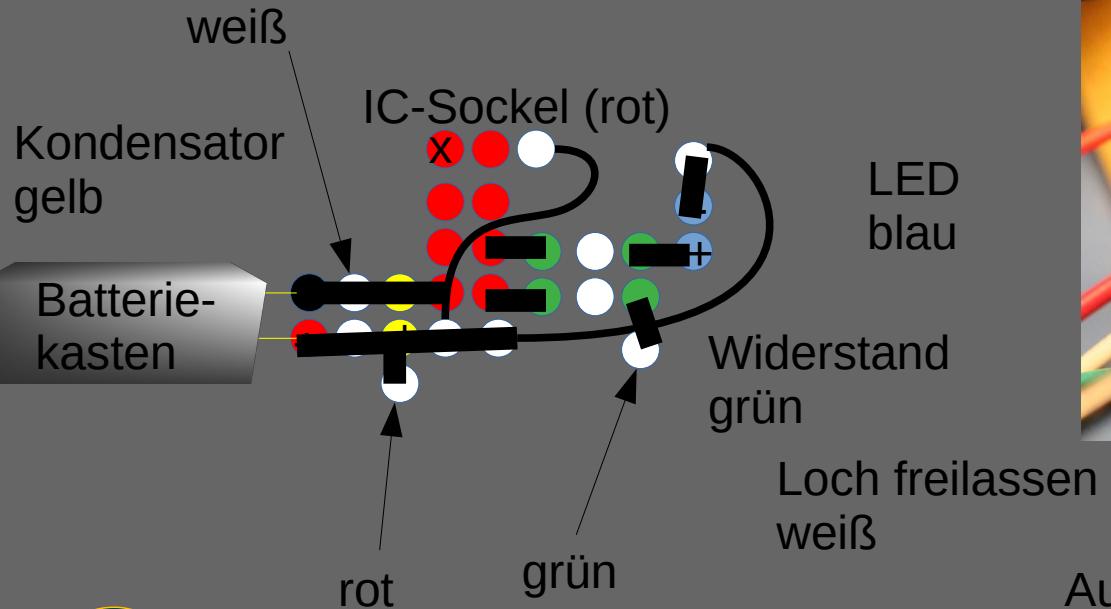

Aufsicht

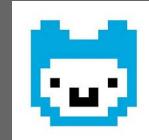

7. Schritt

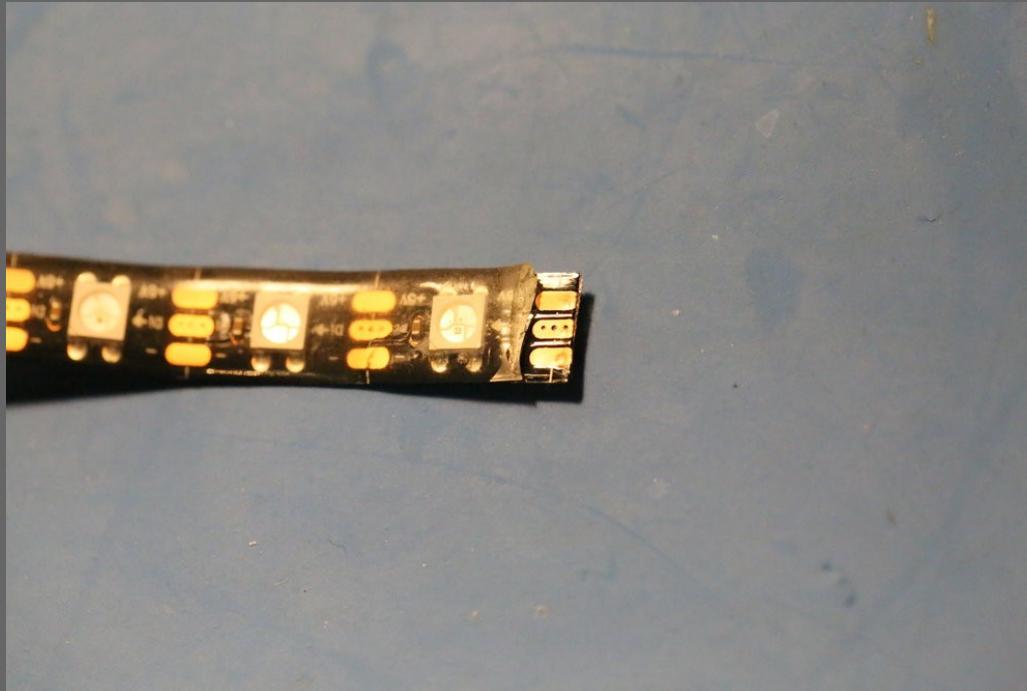

- ATTiny85 einsetzen

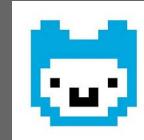

Aufsicht

LED-Stripe verbinden

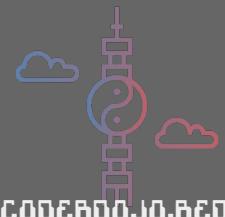

- Stripe in Klemme legen
- Klemme schließen

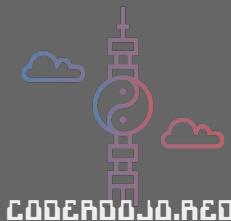

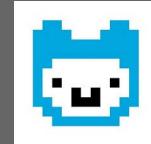

Fruststop

- Solange Du keinen programmierten IC hast, kann es nicht laufen!
- Zum Testen nimmst Du Dir am besten einen vorbereiteten IC.
Danach beginnst Du mit der Programmierung.

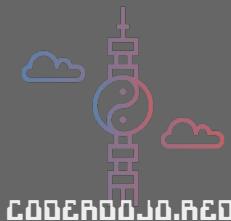

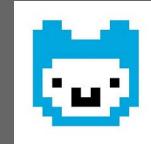

Pause

CODEEROJO.RO

auf zum Code

The screenshot shows the Arduino IDE interface with the title bar "Activities Processing IDE" and "Tue 00:36". The main window is titled "blinker | Arduino 1.8.10". The code editor contains the following sketch:

```
#include <Arduino.h>
#include <avr/power.h> // Required for 16 MHz Adafruit Trinket
#define LED 1

void setup() {
  clock_prescale_set(clock_div_1);
  pinMode(LED, OUTPUT);
}
void loop() {
  digitalWrite(LED,HIGH);
  delay(1000);
  digitalWrite(LED,LOW);
  delay(1000);
}
```

The status bar at the bottom indicates "ATTiny25/45/85, ATTiny85, Internal 8 MHz on /dev/ttyUSB0".
